Multitude of File Formats & Data Types

Open Data Models and File Formats

- Collective (industry, academia, journals, funding agencies) agreement and enforcement
- Data Model – Abstract representation of data
- File Format – XML, TXT, HDF5, ...
- FAIR data principles – Findable, Accessible, Interoperable, Reusable
- Cohesive community, towards reproducible science
- Many communities already have open standards
 - Climate – NetCDF
 - X-ray / Neutron facilities – NeXus
 - Biological Imaging – OME-TIFF, OME-XML ...

Challenges with Scientific Software

- Proprietary software
 - Closed-source
 - Typically inadequate / not possible to expand features
 - Not portable beyond instrument computer
 - Not scalable beyond a few cores on one node
 - Expensive licenses
- Users
 - Do not have access to software
 - Typically not comfortable with scripting / programming
 - Training on software / user-friendliness

Two-prong (inverse) Software Strategy

Mode	Exploratory / Development	Production
Compute Resource	Instrument-local Workstation 	High-performance computing cluster 
Who?	Domain scientists	Collaboration with computational facility
Algorithms	Simpler but approximate	Complex but accurate

Cloud compute

Instrument-to-HPC Workflows

Bellerophon Environment for Analysis of Materials

Many other examples:

- Xi-CAM & CAM-link (LBL)
- ADARA (ORNL)
- Triquetrum
- ...

Python for Scientific Research

Very easy to learn + code

Numerous, **powerful**
libraries for science

NumPy

SciPy

- Facilitates innovation
- More robust code
- Improved adoption of new methods / standards
- Accelerates scientific progress

Cross-
platform

scalable

Scripts to cohesive, collaborative packages

Interoperability with other languages

All for a princely sum of **\$0!**

Ultrafast current imaging by Bayesian inversion

S. Somnath^{1,2}, K.J.H. Law^{1,3}, A.N. Morozovska⁴, P. Maksymovych^{1,2}, Y. Kim⁵, X. Lu⁶, M. Alexe⁷, R. Archibald^{1,3}, S.V. Kalinin^{1,2}, S. Jesse^{1,2} & R.K. Vasudevan^{1,2}

Spectroscopic measurements of current-voltage curves in scanning probe microscopy is the earliest and one of the most common methods for characterizing local energy-dependent electronic properties, providing insight into superconductive, semiconductor, and memristive behaviors. However, the quasistatic nature of these measurements renders them extremely slow. Here, we demonstrate a fundamentally new approach for dynamic spectroscopic current imaging via full information capture and Bayesian inference. This general-mode *I-V* method allows three orders of magnitude faster measurement rates than presently possible. The technique is demonstrated by acquiring *I-V* curves in ferroelectric nanocapacitors, yielding >100,000 *I-V* curves in <20 min. This allows detection of switching currents in the nanoscale capacitors, as well as determination of the dielectric constant. These experiments show the potential for the use of full information capture and Bayesian inference toward extracting physics from rapid *I-V* measurements, and can be used for transport measurements in both atomic force and scanning tunneling microscopy.

Where should data live?

- Centralized repository
- Failure-resistant, redundant-backup
- **Close to compute** resource(s)
- Old / rarely used data can be archived (e.g. tape)

Archival

Data Transfer to Centralized Repository

Scalable Data Efforts at ORNL

Imagine iTunes for Scientific Data

- Organize data by projects (albums)
- Search via metadata (artist, title, genre, ...)
- Make collections (playlists) of datasets
- Access data from any computer
- Publish your own data (songs / album)
- Collaboratively work on projects
- Limit what your siblings can see / listen to
- Simple sign-in like Apple ID
- Fetch data through a standardized interface whether it is coming from one record label or another (CDs, cassette..).
- Quick and robust streaming from / to anywhere

DataFed – a Scientific Data Management System
